IEEE 802.11 is part of the IEEE 802 set of local area network (LAN) protocols, and specifies the set of media access control (MAC) and physical layer (PHY) protocols for implementing wireless local area network (WLAN) Wi-Fi computer communication in various frequencies, including but not limited to 2.4 GHz, 5 GHz, 6 GHz, and 60 GHz frequency bands. They are the world's most widely used wireless computer

IEEE 802.11 - Wikipedia

Computer Network Computer Engineering MCA IEEE 802.11 standard, popularly known as WiFi, lays down the architecture and specifications of wireless LANs (WLANs). WiFi or WLAN uses high-frequency radio waves instead of cables for connecting the devices in LAN. Users connected by WLANs can move around within the area of network coverage.

802.11n (also sometimes known as Wireless N) was designed to improve on 802.11g in the amount of bandwidth it supports, by using several wireless signals and antennas (called MIMO technology) instead of one. Industry standards groups ratified 802.11n in 2009 with specifications providing for up to

802.11® Wireless Networks The Definitive Guide

Wireless networks typically have a great deal of flexibility, which can translate into rapid deployment. Wireless networks use a number of base stations to connect users to an existing network. (In an 802.11 network, the base stations are called access points.) The infrastructure side of a wireless network, however, is qualitatively the same whether you are connecting one user or a million users.

The 802.11 Wireless LAN working group came into existence in 1991 to create standards for 1 MB/sec Radio Frequency (RF) based data network technology. This working group provided the first 802.11 standard in 1997, called the 802.11 Wireless LAN standard, which is implemented at the Physical Layer and the Data Link Layer of the OSI model.

An 802.11a Wi-Fi network supports a maximum theoretical bandwidth of 54 Mbps, substantially better than the 11 Mbps of 802.11b and on par with what 802.11g would offer a few years later. The performance of 802.11a made it an attractive

technology but achieving that level of performance required using relatively expensive hardware.

Flexibility is the big selling point for the "hot spot" market, composed mainly of hotels, airports, train stations, libraries, and cafes. Cost In some cases, costs can be reduced by using wireless technology. As an example, 802.11 equipment can be used to create a wireless bridge between two buildings.
