So we use this:

Product of sines $\sin nx$

$$\sin kx = \frac{1}{2} [\cos(n-k)x - \cos(n+k)x]$$

$$\cos(n-k)x = \frac{1}{2} [\cos(n-k)x + \cos(n+k)x]$$

$$\cos(n+k)x. \quad (4)$$

Integrating $\cos mx$

with $m = n - k$ and m

$= n+k$ proves

orthogonality of the

sines. The exception

is when $n = k$. Then

we are integrating

$$(\sin kx)^2 = \frac{1}{2} [1 - \cos 2kx]$$

$$\cos 2kx: \quad \int_0^{\pi} \sin kx \cos 2kx dx = 0$$

The topic of this chapter, Fourier series, is all about finding out the precise mixture that corresponds to a given shape. Fourier analysis, along with the generalizations examined in the next few chapters, is one

of the most powerful tools of mathematical physics. It has many, many applications in virtually all areas of physics.

Chapter 7: Fourier Series | Physics

Fourier series is a very powerful and versatile tool in connection with the

partial differential equations. A Fourier series is nothing but the expansion of a periodic function $f(x)$ with the terms of an infinite sum of sine and cosine values.
